

The Dynamic Seawall Maintenance System™ (DSMS™) is the Solution to Golf Course Retaining Wall Repairs. No need to tear up your course to repair retaining walls.

Problems with failing retaining walls or bulkheads? The Dynamic Seawall Maintenance System™ (DSMS™) is the answer. Our non-invasive helical anchors will hold walls in place while keeping the surrounding greens and landscaping picture perfect.

DSMS provides a cost effective alternative to complete retaining wall replacement. The system extends the life of the failing walls and diminishes the need for costly new wall construction.

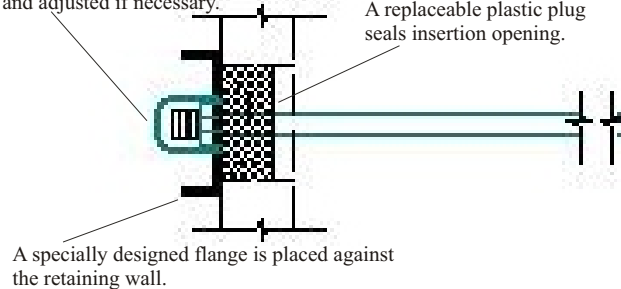

Traditional Methods for installing tie-backs involved tearing up fairways, greens or landscaping. Plus, there are trucks and heavy machinery coming on to your course.

With DSMS technology ... Installations are performed from the waterside of the retaining wall. There's no costly damage to your course and installation time is MUCH quicker.

Threaded end provides "dynamic" advantage by allowing the tie back to be removed and adjusted if necessary.

A replaceable plastic plug seals insertion opening.

A specially designed flange is placed against the retaining wall.

The helix earth screw, used for years in other industries, has been adapted to provide the proper holding power.

Patent No. 6,908,258
Other patents pending

DSMS anchors are engineered to the specific requirements of each location. Standard DSMS anchors are 14' long, 1 1/4" diameter shaft, 6" diameter helixes. Other sizes are available as required.

Installations are performed from the water side of the retaining wall, thereby eliminating costly damage to golf course grounds and irrigation systems. A 3 ft. long wheeled hydraulic rig is the largest piece of equipment needed on the property. The rig bores a hole and drives the 14 ft. Stainless steel screws used to secure the wall and prevent further movement.

A special, hand-wheeled hydraulic rig...

...is used to power the boring of the hole and the installation of the screw.

Why DSMS?

Why the Dynamic Seawall Maintenance System (DSMS)?

- DSMS is roughly five times faster to install than traditional tie-back methods
- DSMS is less expensive to install than full wall replacement
- Golfers will not be turned away from your course due to disruption caused by heavy equipment and the long recovery time associated with traditional wall reconstruction
- DSMS uses stainless steel, environmentally friendly, helical anchors
- DSMS eliminates the need to bring in heavy equipment that often tears up golf course grounds
- DSMS has been field tested in numerous locations and highly praised by golf course superintendents, board presidents and property owners.

“The walls were pulled back and made to look like they did when they were first installed 15 years ago, and I couldn't have been happier with the lack of disturbance to the course.”

Dave Smith, Certified Golf Course Superintendent,
Pelican Marsh Golf Club, Naples, Florida
